SECTION 1

CURRENT WEBSITE ANALYSIS

Company Overview

JAGUAR Ltd. (ООО "ДЖАГУАР") is a Bulgarian company founded in 2002 in Shumen, Bulgaria. The company specializes in importing and distributing high-tech machines for PVC and aluminium window/door frame processing.¹

- Official representative of YILMAZ machines for Bulgaria
- Distributor of GOCMAKSAN (Turkey) since 2009
- Imports high-tech machines for PVC and aluminium window/door frame processing
- Warehouse facility in Plovdiv — professional service and technical support

Phone	+359 (0) 887 973 739
Email	jaguar@jaguar-ltd.com
Address	ul. Dimcho Popov 9, 9700 Shumen, Bulgaria
Website	www.jaguar-ltd.com

Technology Stack

Component	Details
CMS	WordPress
Theme	Ave/Liquid (v6.9.4) — Commercial WordPress theme with visual page builder
Page Builder	WPBakery / JS Composer v6.7.0
SEO Plugin	Rank Math
Forms	Contact Form 7 v6.1.5
CSS	Bootstrap, custom Liquid CSS, Font Awesome
JavaScript	jQuery 3.7.1, jQuery UI, jQuery Migrate, Flickity, Fresco, Lity
Fonts	Google Fonts, Liquid Icons, Font Awesome
Analytics	Google Analytics 4 (GA4) — Tracking ID: G-4TDQ9Q3FLH via MonsterInsights v10.0.3

Site Structure

The website has a straightforward hierarchical structure with a home page and primary navigation to product categories and company pages.¹

Page	URL Path	Notes
Home	jaguar-ltd.com	Main landing page
About Us	/about-us/	Company information
PVC Profile Processing Machines	/pvc-profile-processing-machines/	35+ models
Aluminium Profile Processing Machines	/aluminium-profile-processing-machines/	38+ models
Portable Profile Processing Machines	/portable-profile-processing-machines/	4 models
Support Equipment	/support-equipments/	19+ items
Contact Us	/contact-us/	Contact form and info
English Version	/en/	English language site

Product categories include: End milling, copy routers, cutting/sawing, welding, corner cleaning, processing centers, corner crimping, CNC routers, composite panel processing, facade notching, assembly stations, conveyors, and more.

Language Support

- Primary language: Bulgarian (bg-BG)
- Secondary language: English at /en/
- Has language switcher dropdown + proper hreflang tags

SECTION 2

PERFORMANCE AUDIT

Performance analysis conducted using Google PageSpeed Insights.²

PageSpeed Insights Scores

Metric	Mobile	Desktop
Performance	49/100 (POOR)	81/100 (Good)
Accessibility	93/100 (Good)	88/100 (Good)
Best Practices	77/100 (Good)	77/100 (Good)
SEO	100/100 (Excellent)	100/100 (Excellent)

Core Web Vitals

Metric	Mobile	Desktop	Status
LCP (Largest Contentful Paint)	8.1s	2.0s	Mobile: POOR
CLS (Cumulative Layout Shift)	0.272	0.118	Both: Needs improvement
TBT (Total Blocking Time)	150ms	70ms	Acceptable

Key Performance Issues

1. Render-blocking requests — 4,010ms savings possible (mobile)
2. Font display issues — 470ms savings possible
3. Unoptimized images — 425 KiB savings (no WebP, no srcset)
4. Unused JavaScript — 233 KiB to trim
5. Unused CSS — 153 KiB to trim
6. Image elements without explicit width/height — Causes CLS
7. Long main-thread tasks — 4 tasks on mobile
8. Insecure HTTP request — 1 detected
9. Color contrast accessibility issues — WCAG violation
10. Links without discernible names — Accessibility issue

2. Source: Google PageSpeed Insights, <https://pagespeed.web.dev/>

SECTION 3

MOBILE RESPONSIVENESS

8 / 10

Current Mobile Responsiveness Score

Current Status

Feature	Status
Has hamburger menu	YES
Navigation mobile-friendly	YES
Images responsive	YES (but no srcset/picture elements)
Text readable	YES
Buttons tappable	YES
Layout adapts	YES

Issues Found

- No srcset or picture elements — full desktop images load on mobile, increasing load time and data usage
- Top bar crowded at 390px width — phone, email, and language switcher compete for space
- Small touch targets for search icon and language switcher (below 44x44px recommended)
- Contact form two-column layout may break on narrow screens

SECTION 4

CRITICAL ISSUES IDENTIFIED

PRIORITY 1

GDPR / Legal Compliance (URGENT)

This is a legal requirement in the EU/Bulgaria and must be addressed immediately.

- **NO cookie consent banner** — Required by GDPR for any site using analytics or tracking
- **NO privacy policy page** — Must disclose data collection and processing practices
- **NO terms of service page** — Important for legal protection

PRIORITY 2

Mobile Performance

- Mobile Performance score: 49/100 (POOR) — Google considers this a failing score
- LCP 8.1s on mobile — Should be under 2.5s; current value is more than 3x the acceptable threshold
- CLS 0.272 on mobile — Should be under 0.1; layout instability degrades user experience
- Heavy images load full desktop versions on mobile — wastes bandwidth and slows rendering

PRIORITY 3

Design & UX Modernization

- Dense text blocks need visual breaks and improved typography
- Loading states show blank areas — skeleton screens or loading indicators needed
- Product cards need better hover interactions and visual feedback
- Low contrast in some text areas — WCAG accessibility violation
- Minimal footer — needs expansion with links, contact info, and social media
- More CTAs (calls-to-action) needed throughout the site

PRIORITY 4

Content & SEO

- Meta descriptions too brief — need 150–160 characters for optimal SERP display
- No blog or content marketing section — missed opportunity for organic traffic
- Product pages need more detailed specifications and technical data
- No breadcrumbs visible — impacts navigation and SEO
- Missing Product schema/structured data — no rich snippets in search results
- Internal linking could be significantly improved for SEO value

SECTION 5

TRAFFIC & ANALYTICS

The site has Google Analytics 4 (GA4) installed with tracking ID G-4TDQ9Q3FLH via the MonsterInsights plugin (v10.0.3).¹

To access detailed click and visit data, the following steps are required:

1. Connect the Google Analytics account associated with this property
2. Access is available through the Google Analytics dashboard or by connecting the GA connector

NOTE: A Google Analytics connector is available but currently disconnected. The site owner needs to authorize access to view actual traffic metrics including: visits, clicks, bounce rate, user demographics, acquisition channels, top pages, conversion rates, and geographic distribution.

Once connected, the analytics data will provide insights into:

- Total visits and unique users per month
- Most visited pages and user flow
- Bounce rate and session duration
- Traffic sources (organic search, direct, referral, social)
- Geographic distribution of visitors
- Device breakdown (mobile vs. desktop vs. tablet)
- Conversion tracking (form submissions, quote requests)

SECTION 6

IMPROVEMENT PLAN — REBUILD WITH MODERN STACK

Recommended Approach

Static Site Generator + GitHub Pages → Future Migration

The recommended approach is to rebuild the website using a modern static site generator, deploy initially on GitHub Pages, and migrate to a production hosting platform when ready for advanced features.

Phase 1: GitHub Repository Setup (Week 1-2)

- Create repository: github.com/v-s-p/jaguar-ltd-website³
- Tech stack: Next.js 14+ (App Router) or Astro 4+ with TailwindCSS
- Set up GitHub Pages or GitHub Actions for CI/CD
- Create project structure with i18n (Bulgarian + English)
- Set up development environment with linting and testing

Phase 2: Design System & Core Pages (Week 3-5)

- Create modern, mobile-first design system with component library
- Implement responsive navigation with smooth mobile hamburger menu
- Build core pages: Home, About, Contact
- Implement dark/light mode toggle
- Add proper cookie consent (GDPR compliance)
- Add Privacy Policy and Terms of Service pages
- Use modern image formats (WebP/AVIF) with srcset for responsive images
- Implement proper meta tags, Open Graph, and structured data

Phase 3: Product Catalog (Week 6-8)

- Design product category pages with filtering and sorting
- Build individual product pages with specs, images, and gallery
- Implement search functionality across all products
- Add breadcrumbs and improved internal linking
- Create product comparison feature
- Add JSON-LD Product schema for rich search results

Phase 4: Content & SEO (Week 9-10)

- Add blog/news section for content marketing
- Write optimized meta descriptions (150-160 characters)
- Implement sitemap.xml and robots.txt
- Set up proper 301 redirects from old WordPress URLs
- Create content calendar for ongoing updates

Phase 5: Testing & Launch (Week 11-12)

- Lighthouse audit targeting: Performance 90+, Accessibility 100, SEO 100
- Cross-browser testing (Chrome, Firefox, Safari, Edge)
- Mobile testing on real devices (iOS and Android)
- Load testing and performance benchmarking
- DNS migration and go-live

GitHub Deployment Strategy

Component	Configuration
Repository	github.com/v-s-p/jaguar-ltd-website
Branching	main (production), develop (staging), feature/* branches
CI/CD	GitHub Actions for build + deploy
Initial Hosting	GitHub Pages (free, HTTPS, custom domain support)
Preview	Preview deployments for pull requests

Future Hosting Migration Options

After initial deployment on GitHub Pages, these are the recommended production hosting options:

Service	Cost	Best For	SSL	CDN	Custom Domain
Vercel	Free tier / \$20/mo Pro	Next.js sites, fastest DX	Yes	Global Edge	Yes
Netlify	Free tier / \$19/mo Pro	Static + serverless	Yes	Global CDN	Yes
Cloudflare Pages	Free / \$20/mo Pro	Performance-critical	Yes	Global (200+ PoPs)	Yes
AWS Amplify	~\$5-15/mo	Full AWS ecosystem	Yes	CloudFront	Yes
DigitalOcean App	\$5/mo	Simple deployments	Yes	Global CDN	Yes

Recommended path: Start with GitHub Pages → migrate to Vercel or Cloudflare Pages when ready for production features like edge functions, server-side rendering, analytics, and advanced form handling.

Technology Stack Comparison (Old vs. New)

Aspect	Current (WordPress)	Proposed (Modern)
Framework	WordPress + WPBakery	Next.js 14 or Astro 4
Styling	Bootstrap + Custom CSS	TailwindCSS 3
Performance	49 mobile / 81 desktop	Target: 95+ / 99+
Images	Unoptimized JPEG/PNG	WebP/AVIF with srcset
Hosting	Shared hosting	GitHub Pages → Vercel/CF
Security	WP plugin vulnerabilities	Static site (minimal attack surface)
Maintenance	WP + plugin updates	Git-based, version controlled
Build	Server-rendered PHP	Static/SSG (pre-built HTML)
i18n	WordPress plugin	Built-in framework i18n
SEO	Rank Math plugin	Built-in meta, JSON-LD

3. GitHub: <https://github.com/v-s-p>

SECTION 7

ESTIMATED TIMELINE & BUDGET

DIY Timeline (using GitHub)

Phase	Description	Duration	Key Deliverables
Phase 1	Repository Setup	1-2 weeks	Foundation and tooling
Phase 2	Design System & Core Pages	2-3 weeks	Mobile-first design, GDPR compliance
Phase 3	Product Catalog	2-3 weeks	90+ product pages, search, filtering
Phase 4	Content & SEO	1-2 weeks	Blog, meta tags, redirects
Phase 5	Testing & Launch	1-2 weeks	QA, cross-browser, go-live

Total Estimated Duration: 8 — 12 weeks

Hosting Costs

Item	Cost	Notes
GitHub Pages	FREE	Initial deployment, HTTPS included
Custom Domain	Already owned	jaguar-ltd.com
Future Vercel / Cloudflare	\$0 — \$20/month	When ready for production features
SSL Certificate	FREE	Included with all recommended services

Total ongoing cost: \$0 — \$20/month (compared to typical shared WordPress hosting costs of \$5-15/month with less performance).

SECTION 8

NEXT STEPS

The following actions are recommended in order of priority:

1. **IMMEDIATE:** Implement GDPR compliance on the existing site — add cookie consent banner, privacy policy, and terms of service. This is a legal requirement.
2. Connect Google Analytics to retrieve current traffic data (clicks, visits, demographics, acquisition channels) for baseline measurement.
3. Create the GitHub repository for the new site at github.com/v-s-p/jaguar-ltd-website.
4. Choose the framework — Next.js is recommended for the product catalog + i18n requirements; Astro is a lighter alternative if server-side features are not needed.
5. Begin Phase 1 with design mockups and project structure setup.
6. Migrate content from WordPress — export all posts, pages, product data, and images.

This analysis was prepared by Perplexity Computer on March 15, 2026.
